SUMMARY

I am a dedicated professional with proficiency in Generative AI and Prompt Engineering where I develop efficient prompts for AI models such as GPT-4 and achieve accurate results. Some of my skills include creating proper prompts, adjusting the AI models, and using generative AI to help complete tasks, enhance creativity, and address various issues. Thus, I am ready to learn new things and improve my skills, which is why I always follow the latest trends in the field of AI to create effective solutions that can enhance performance and lead to automation. Therefore, I am prepared to delve into the latest advancements in AI and play a role in driving progress within the field.

EDUCATION

10th

Maharishi Vidya Mandir Senior Secondary School

07/2019 - 2020 *Chennai*

12th

Maharishi Vidya Mandir Matric Hr Sec School

2020 - 2022 *Chennai*

PURSUING BE-Computer Science Engineering

SA Engineering College

July 2022 - July 2026 *Chennai*

EXPERIENCE

Software Developer Intern

Marzelet Info Tech

January 2026 - Present *Chennai*

- Responsibilities
- Developed and fine-tuned AI-driven applications using prompt engineering techniques to solve real-world problems.
- Built and tested front-end UI components using no-code/low-code platforms like Bolt, Lovable, and Vibe Code Studio.
- Designed intelligent workflows using LLMs for user-specific automation, recommendation systems, and dynamic decision-making.
- Collaborated with design and AI teams to craft effective prompts that enhanced the quality and accuracy of AI-generated outputs.
- Integrated third-party APIs and backend services (e.g., Supabase, Netlify) to support scalable project architectures.
- Conducted continuous experimentation with prompt variants to improve response reliability, user experience, and model alignment.
- Achievements
- Successfully launched AI-powered inventory management and skill swap platforms using prompt-based logic and no-code tools.
- Engineered prompt templates that improved response accuracy by 30–40% across different LLMs.
- Designed intuitive user flows using Vibe Code Studio that reduced build time by over 50% compared to traditional development.
- Featured internally for delivering rapid prototypes using only prompt engineering and visual development tools.
- Completed multiple AI tool-based projects end-to-end without traditional coding, demonstrating high adaptability and creative problem-solving.

PROJECTS

InvexAI

React , Tailwind Css , Python , Gemini , lovable invexai.netlify.app

- Invex AI is an intelligent inventory management system developed to streamline and automate stock monitoring, sales data analysis,

and demand forecasting for small to medium-sized enterprises (SMEs). The project leverages modern frontend technologies such as

React, TypeScript, TailwindCSS, and Vite, while integrating Supabase for backend services including authentication and database management. The user interface was developed with the assistance of Lovable.dev, an AI-based low-code platform that accelerates the creation of responsive and component-driven UIs.

- The system is divided into two main modules:
- Authentication and User Management:
- Built with Supabase, this module securely handles user sign-up, login, and session management. It ensures that business data remains protected and accessible only to authorized users.
- AI-Powered Inventory Dashboard:
- Once authenticated, users are directed to a dynamic dashboard that allows them to:
- Upload past sales records manually or via file uploads.
- View and manage current stock levels in real-time.
- Receive AI-assisted suggestions for restocking and demand forecasting based on historical data.
- Gain insights into product performance and trends through a clean, analytics-driven UI.
- The core idea behind Invex AI is to reduce manual effort in managing inventory and to provide businesses with data-backed insights that improve operational efficiency. By using lightweight and scalable tools, the platform is optimized for performance and is easily deployable on modern web hosting environments.
- Furthermore, the project is structured to be open-source, encouraging collaboration, adaptation, and extension by developers or business users. It is designed with scalability in mind, so features like multi-user roles, notification systems, and deeper AI integrations

(e.g., time-series forecasting or anomaly detection) can be integrated seamlessly in future versions.

Skillswap

React , Tailwind Css , Python , Gemini , lovable , Firebase

https://skillswappro.netlify.app/

- Skill Swap is a fully-deployed and completed web platform that facilitates peer-to-peer skill exchange, enabling users to trade their current skills for acquiring new ones. The project seeks to establish an open, free, and community-based learning environment where time and knowledge are the main currencies.
- The site enables real connections to be made by having members post skills they have and skills they want to acquire. A tailor-made matching system brings users together according to complementary requirements, fostering a culture of collective development.The user experience is enhanced through real-time communication, review systems, and personalized learning dashboards.
- Key Features:
- User Authentication & Profile Management: Powered by Supabase, enabling secure sign-up/login, profile customization, and skill tagging.
- Skill Exchange Matching System: Matches users based on shared interests, skill level, availability, and location (optional), enabling efficient learning swaps.
- Real-Time Chat Integration: In-app messaging system to plan sessions, share materials, and coordinate exchanges seamlessly.
- Feedback & Ratings Module: Builds trust and reputation by allowing users to rate and review each other post-session.
- Interactive Dashboard: Tracks ongoing exchanges, history of skill trades, progress reports, and notifications to keep users engaged.
- Technology Stack:
- Frontend: HTML5, CSS3, JavaScript
- Backend & Database: Supabase (PostgreSQL-based) for authentication, data storage, and serverless backend functionalities
- Deployment: Hosted on Netlify, ensuring fast performance and continuous deployment from GitHub
- Tools: GitHub for version control and team collaboration
- This project demonstrates my ability to design and deliver scalable, full-stack applications using modern serverless technologies. Skill Swap not only solves a real-world problem but also showcases my strengths in system design, frontend-backend integration, and user-focused product development.

Hella

React , Tailwind Css , Python , Gemini , lovable

https://hellalogin.netlify.app/

- Hella is an advanced AI-powered chatbot for intelligent, human-like conversations. Like other top AI assistants, Hella can answer questions, complete tasks, create original content, and provide real-time insights in many domains. From research to coding, business strategies to casual discussions, Hella learns to adapt to your needs with personalized and efficient support.
- Powered by cutting-edge AI models, Hella understands natural language, making interactions seamless and engaging. It continuously learns and improves, ensuring accurate responses and an intuitive user experience.
- Hella is not just a chatbot; it's your smart assistant, ready to assist anytime, anywhere!
- It is still at the developing side but still u can use it

E-commerce Platform

React , Tailwind Css , Python , V0 , lovable , Replit e-commerce.netlify.app

Created and released a smart, AI supported billing tool that helps users create invoices for retail and business purposes. Utilized a no-code tools and prompt engineering processes for this project to develop an easy to use, responsive web application to create and manage invoices in a quick and efficient manner.

The application has:

- Automated invoice number flow with a custom prefix (ie. "MRZ").
- Real-time display of product, quantity, rate and total billing table.
- Easily accessible interface, from desktop and mobile access.
- Invoices and other organizational documentation can download and print for carrying or record purposes. - Hosted in Netlify for speed and sharing vacations.

Impact:

- Eased billing process for small businesses and vendors.
- Showcased the capability to create real-world tools with prompt engineering with no-code tools.
- A deployed production with functional capabilities that demonstrates the data, screen, and processes involved in development without traditional coding.

Billing Software

React , Tailwind Css , Python , Gemini , lovable om-muruga-billing.netlify.app

Developed a custom billing system made specifically for a daily operation in a mechanic shop. The system made the process of generating service and parts invoices much simpler, faster, more accurately and professionally. The platform was built using no-code tools, with prompt engineering utilized, and added features such as automated calculations, customizable invoice set-up, along with a clean mobile screen format that a mechanic shop would use on the go.

Key Features:

- Professional invoices that are auto-numbered starting at "MRZ" and pre-filled.
- Billable for labor charges and spare parts.
- Real-time calculations for quantities, rates, and total amount.
- Option to print invoices or download and save the invoice for the customer and shop record.
- Clean and simple/clean UI for the mechanics workflow.
- Hosted on Netlify, so it could be accessed quickly and reliably on any device.

Impact:

- More accurate billing and human error was taken out of the mechanic workshop.
- The mechanic shop was faster and easier for customers to checkout and records for the shop's services rendered.
- Showcased what happens when AI tools and no-code platforms are used to create business solutions in the real world.

Hoops Hub

React , Tailwind Css , Python , Bolt , lovable https://deluxe-gumption-e4e2c7.netlify.app/

Hoops Hub is an online store that specialises in the sale of basketballs and other basketball-related products for both amateur and professional athletes. No matter what your experience on the court is the site offers top-of-the-line basketballs, accessories and equipment to improve your performance. With simple and intuitive menus as well as a safe and secure checkout process, the customers can choose and acquire the products they require to improve their experience when practising basketball. It also contains several sections that contain information about the products including their specifications and customers' reviews to assist the buyers in choosing the right products.

Sap Hrerp

React , Tailwind Css , Python , V0 , lovable , Replit https://saphr.netlify.app/

I am currently involved in developing and configuring a SAP HR (Human Resource) ERP system as part of an internship for enterprise workforce management. The project will digitize and then modernize enterprise HR-specific operations, including employee master data, attendance, and leave and payroll integration - essentially core HR functions - by utilizing the HCM module of SAP. This is a long-term project with the goal of fully integrating an HR system, including all available modules, and reflecting realistic HR operational workflows in enterprise systems.

Some of my main duties are:

Assistance with the setup of organizational structures and employee hierarchies located in SAP

The configuration of the Personnel Administration, Organizational Management, and Time Management module To learn and

execute SAP transaction codes (T-Codes) in real-time to complete HR functions.

Participate in designing and testing leave policies, attendance types, and work schedules

Assisting with the individual user manual and overall documentation of the processes in the HR system.
Outcomes that we expect:

The development of a centralized ERP based HR system in order to improve centralization of employee data management and improvements in HR operations.

Better automation of HR processes and accuracy provided by SAP HCM through enterprise HR functions.

Real-time reports and analytics of workforce data that supports real-time decisions.

SKILLS

HTML | CSS | JavaScript | React | Firebase | Git | Generative AI | AI Tools Specialist | Generative AI Solutions Architect | API Integration for AI Solutions | Debugging AI Output and Error Handling | AI-powered code optimization
